

Backline Settings For iOS Devices

Within the Settings menu of your iOS device, you can adjust settings pertaining to individual apps. Simply access the Settings menu and locate Backline.

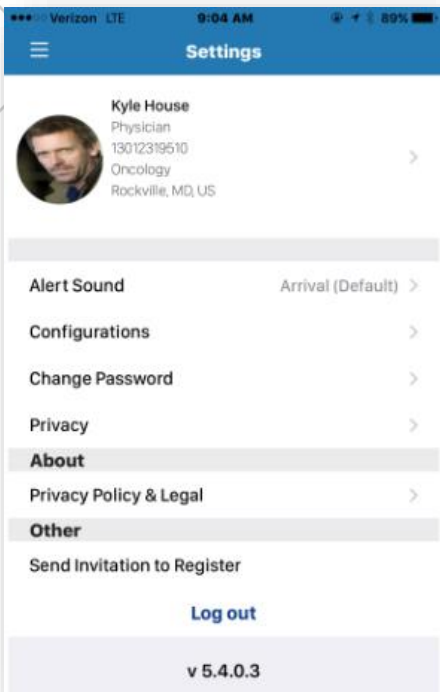

You can set exactly what you wish Backline to have access to within your mobile device. For example, enabling access to Photos and Camera will allow you to attach photos or take photos within Backline. If Cellular Data is disabled, Backline will only function when connected to WiFi.

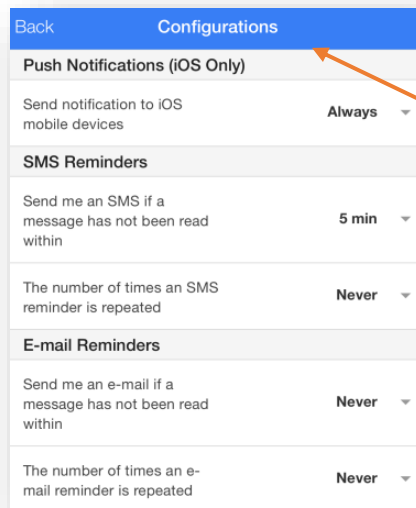

If you tap on **Notifications** you can choose to allow notifications for Backline, specifically where they appear. In order to receive notifications for Backline messages to your mobile device, the **Allow Notifications** switch must be enabled.

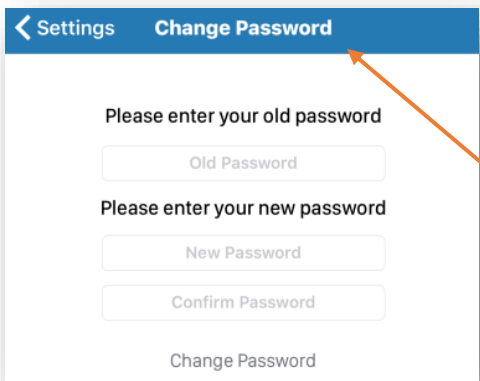

You can also set the Alert Style for when your iOS device is unlocked.

Once logged into Backline, if you tap the menu icon you will be able to adjust any settings within the application. This includes setting up your profile, setting the alert sounds, managing configurations, changing your password, and adjusting privacy settings. Simply tap the arrow next to any setting you wish to manage.

Update Push Notifications and SMS/E-mail Reminders

Change your password.

Update personal privacy settings.
